

Dentistry & Salli

Traditionally dental care has never been ergonomic. The most efficient way of improving ergonomics in a dental environment is to use a saddle chair. Salli saddle chair makes intensive work possible and ensures good view to patient's mouth without creating any back problems.

With Salli Saddle Chair:

- Your back strengthens
- You breathe more deeply
- Blood circulation in your legs increases
- The view over to the patient's mouth improves
- Co-ordination is easier

SALLI SADDLE CHAIR

Recommendation by a private dental clinic for the Salli Saddle chair®

“We bought our first Saddle Chair in 1996 and very soon discovered its good effects on the work ergonomics and health. After that we provided all 14 people in our nursing and reception staff with Salli. Right now none of our employees would work without Salli. Our experience with Salli has shown that a better posture reduces muscle tension, resulting in increased productivity and better working quality. The working environment is more pleasant as well as being, valued also by the patients.”

A satisfied person works more efficiently.
Well-being shines through!
